Burndown Chart

1. Did your estimations reflect the actual effort?

Yes, the story point estimates provided a reasonable representation of the relative effort required for the User Stories. Stories estimated at 5 points involved moderate effort, while the 8-point Stories represented greater complexity and uncertainty. Since all 31 planned story points were completed across the two simulated sprints, the estimates were generally appropriate for the exercise. However, because this was a simulated sprint, the estimates cannot be considered a precise measure of actual development time.

2. Was your backlog well-prioritized?

Yes. The backlog was prioritized according to the importance and impact of the functional requirements. All five User Stories were assigned High priority because they represented essential capabilities of the feature flag management system, including evaluation, rollout configuration, environment configuration, flag management and client SDK synchronization. The higher-priority Stories were selected for Sprint 1, while the remaining Stories were completed in Sprint 2.

3. How did your simulated sprint align with your plan?

The simulated sprints aligned with the planned backlog and estimation. Sprint 1 contained three User Stories totaling 18 story points, while Sprint 2 contained the remaining two Stories totaling 13 story points. The Stories were moved through To Do, In Progress and Done to simulate the development workflow. Both sprints were completed successfully.

4. What insights did the burndown chart give about your team's capacity?

The Burndown Chart showed that the team was able to complete the planned 18 story points during Sprint 1. The sharp decrease in remaining work indicates that the work was completed quickly during

the simulation rather than gradually throughout the sprint. In a real project, a sharp drop could indicate that work was not estimated or broken down accurately. The chart therefore provides useful information about whether the team's planned workload matches its actual capacity.

Conclusion

This lab demonstrated the Agile workflow of converting functional requirements into Epics and User Stories, prioritizing the backlog, estimating effort using story points, planning and executing two sprints, and analysing progress using a Burndown Chart. The Feature Flag Management backlog consisted of five Epics and five User Stories with a total of 31 story points. All planned work was completed across the two simulated sprints.
